TISSUE SPECIFICITY: Detected in the heart, spleen, lung,
peritoneal exudate cells and leukcytes.
SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mus musculus (Mouse),

I. J. Neurosci. Res. 45:382-391(1996).
I. SUNCTION: Receptor for the MCP-1 (UE), MCP-3 (FIC) and MCP-5
C clenium fons level.
C -1 SUBCELLULAR LOCATION: Incegral membrane protein.
II SUBCELLULAR LOCATION: Detected in monocyte/macrophage cell lines,
Dut not in nonhematopoietic cell lines.
C -1 SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              REMEL; U47035; AAC52453.1; ---

Sul N., Treboute C., Gomas E., Ferchal F., Alizon M.;

Submitted (ULL-1997) to the EMBL/GenBank/DBM databases.

-!- FUNCTION: Receptor for a C-C type chemokine. Binds to ectaxin, MCP-3, MCP-4 and RAMTES and subsequently transduces a signal by increasing the intracellular calcium ions level.

-!- SUBCELLULAR LOCATION: Integral membrane protein.

-!- SUMILARITY: Belongs to family 1 of G-protein coupled receptors. Cercopithecus aethiops (Green monkey) (Grivet).

Bukaryota, Metazoa, Chordata, Graniata, Vertebrata, Euteleostomi,
Mammalia, Butheria, Primates, Catarrhini, Cercopithecidae,
Cercopithecinee, Cercopithecus.

PATHWAY: Cyclic peptide antibiotic surfactin biosynthesis. SIMILARITY: Belongs to the ATP-dependent AMP-binding enzyme

-!- SIMILARITY: Contains 3 acyl carrier domains

-!- FUNCTION: PART OF THE BINDING-PROTEIN-DEPENDENT TRANSPORT SYSTEM FOR FERRIC ENTEROBACHTIN. PROBABLY RESPONSIBLE FOR THE TRANSLOCATION OF THE SUBSTRATE ACROSS THE MEMBRANE.
-!- SUBCELLIARA LOCATION: Integral membrane protein. Inner membrane.
-!- INDUCTION: Controlled in part by the amount of available irron.
-!- SIMLLARITY: Belongs to the binding-protein-dependent transport system permease family.
                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Chenault S.S., Earhart C.F.; "Organization of the Escherichia coli ferrienterobactin permease."; Mol. "The complete genome sequence of the Gram-positive bacterium Bacillus subtilis.";

Nature 390:484-256(1997).

-!- FUNCTION: This protein is a component of an oligopeptide permease, a binding protein-dependent transport system. This APP system can completely substitute for the OPP system in both sporulation and genetic compenence, though, unlike OPP, is incapable of transporting tripeptides. Probably responsible for the translocation of the substrate across the membrane (By Nature 390:249-256(1997)

similarity).
SUBCELLULAR LOCATION: Integral membrane protein (Potential).
SIMILARITY: Belongs to the binding-protein-dependent transport system permease family. OppBC subfamily.

Immunol. 161:6139-6147(1998).

-!- FUNCTION: Receptor for a C-C type chemokine. Binds to eotaxin, MCP-3, MCP-4 and RANTES and subsequently transduces a signal by increasing the intracellular accellulation increasing the intracellular accellular accellular accellular accellular accellular accellular coupled for similarity)
-!- SUMCELULAR LOCATION: Integral membrane protein.
-!- SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                        30-MAY-2000 (Rel. 39, Created)

    macrophages.
    -!- INDUCTION: In animals in which experimental allergic encephalomyelitis (EAE) has been induced.
    -!- SIMILARITY: Belongs to family 1 of G-protein coupled receptors.

TISSUE SPECIFICITY: EXPRESSED IN 20-22 SENSORY NEURONS ON THE
MEDIAL-PROXIMAL EDGE OF THE ANTENNA. THIS EXPRESSION PATTERN
MATCHES THE DISTRIBUTION OF THE LARGE SENSTILA BASICONICA.
EXPRESSION IS FIRST SEEN AT 60 HOURS APF IN A SUBSET OF CELLS
RESTRICTED TO A SUBREGION OF THE DEVELOPING ANTENNA. EXPRESSION
CONTINUES TRROUGHOT ANTENNAL DEVELOPMENT.
SIMILARITY: Belongs to family Dr-or of G-protein coupled
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MVKLAFTVVTIVKOFNLAEKFQ -> VSINQYEL (IN

These are similar to the human chemokine receptors CRS. CXCR4 and STR13, as well as CR4. These are useful in the treatment of HIV, as they prevent replication of the virus. The present sequence is an example of a peptide of the invention
                                                                                                                  Human chemokine receptor; CD4; HIV; glycoprotein 120; gp120; antagonist; replication; CCR5; CXCR4; CD4; STRL33.
                                                                                                                                                                                                                                                                                                                                                                                                               Novel polypeptides useful for treating HIV infection, have homology to regions of domains of human chemokine receptors CCR5, CXCR4 and STRL33, and binds to HIV gpl20 under physiological conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ..

The invention relates to novel isolated polypeptides, mature form of the polypeptide, a sequence that is 95% identical to the polypeptide or the polypeptide comprising one or more conservative substitutions. The Novx polypeptide is useful for treating or preventing a pathology associated with the polypeptide e.g. disorders associated with aberrant expression or activity of the polypeptide, such as cancer, diabetes, obesity, and endocrine. CNS and inflammatory disorders. They can also be used in various detection and screening assays, chromosome mapping, issue typing and predictive medicine. This sequence corresponds to one of the
                                                                                        New isolated NOVX polypeptides and nucleic acid molecules useful for treating, preventing and diagnosing pathological conditions with NOVX-associated disorders, such as cancer, obesity, diabetes and inflammatory or CNS diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cytostatic; antidiabetic; anorectic; cerebroprotective; neuroprotective; antiinflammatory; gene therapy; antisease therapy; thyrominetic; NOVX; pathology; cancer; diabetes; obseity; endocrine disorder; CNS disorder; inflammatory disorder; chromosome mapping; tissue typing;

```

The invention relates to novel isolated polypeptides, mature form of the polypeptide, a sequence that is 95% identical to the polypeptide or the polypeptide comprising one or more conservative substitutions. The NOVX polypeptide is useful for treating or preventing a pathology associated with the polypeptide e.g. disorders associated with aberrant expression or activity of the polypeptide, such as cancer, diabetes, obesity, and endocrine, CNS and inflammatory disorders. They can also be used in and predictive medicine and screening assays, chromosome mapping, tissue typing and predictive medicine. This sequence corresponds to one of the 100.0%; Score 118; DB 7; Length 268; 100.0%; Pred. No. 2.1e-11;

Wilde CG; Coleman R, Bandman O, Au-Young J,

1997-549729/50. N-PSDB; AAT99542. Polynucleotide encoding MMLR-CCR or MPHG-CCR chemokine receptor - useful to study, diagnose and treat, e.g. infection, inflammation, solid tumour and proliferative and cardiovascular disease.

Claim 8; Page 37-38; 59pp; English.

This protein comprises human MMLR-CCR, a novel C-C chemokine receptor associated with monocyte/macrophage infiltration and chemotaxis and haematopoiesis. The amino acid sequence was deduced from a cDNA clone (see AAT99542) obtained from a cDNA library made from monouclear cells collected on day 2 of a mixed lymphocyte culture, i.e. cells associated with inflammation and immunomodulation. Another novel chemokine receptor, MPHG-CCR (see AAM36767), is also claimed. MMLR-CCR contains 7 transmembrane spanning segments connected by a serives of intracellular and extracellular loops. MMLR-CCR and be used to study, diagnose and treat disease states in which normal leukocyte function is perturbed by normal leukopoiesis or inappropriate activation via chemokine agonists or antagonists, such as infection, inflammation, proliferative disease, tumourigenesis, autoimmune disease, abnormal cell proliferation, solid tumours, cardiovascular disease, rheumatoid arthuring, allocalities, atherosclerosis, chronic granulomatous disease, asthma, myasthenia gravis, diabetes, inflammatory bowel disease, toxic shock syndrome, septic shock and Chediak-Higashi syndrome

RESULT 5 AAW27407 ID AAW27407 standard; protein; 352 AA.

Human CCR5.

AAW27407;

```
This polypeptide sequence comprises novel human chemokine receptor 88C, a G protein coupled receptor that is involved in leukocyte trafficking. Its amino sequence was deduced from a cDNA clone (AATS161) isolated from a marcophage library. It shows 62* identity to CCCRR1. Chemokine receptor 88-28 (see AAW27124) has also been identified. 88C and 88-2B receptors and their polypeptide fragments can be produced in transformed host cells. The receptors, peptides comprising occ more of the extracellular or intracellular domains, and anti-receptor antibodies can be used to modulate receptor activities, particularly ligand and G brotein binding, and are potentially potentially useful in the treatment of atheroslerosis, theumatoid arthritis, tumours, asthma, viral infection, AIDS, inflammatory conditions, pathological immune response, abnormal haematopoietic processes etc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid encoding chemokine receptors 88-2B and 88C - used modulate leukocyte trafficking, e.g. for treatment of inflammation, tumours, viral infections, auto-immune diseases, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           100.0%; Score 118; DB 2;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is human CC (Cys-Cys) chemokine receptor 5 (CCR5), which is stimulated by MIP-1 alpha, MIP-1 beta or RANTES chemokines, but not by monocyte chemoattractant protein 1 (MCP-1), MCP-2, MCP-3, interleukin-8 (IL-8) or growth related gene product alpha (GRO alpha) chemokines. Active CCR-5 is also a receptor of human immunodeficiency virus type 1 or type 2 (HIV-1 or HIV-2). CCR5 or its cDNA can used to diagnose, treat and/or prevent inflammatory diseases, e.g. rheumatoid arthritis, glomerulonephritis, asthma, idiopathic pulmonary fibrosis and psoriaals, viral infections, especially HIV-1 or HIV-2 infection, cancer, atherosclerosis and autoimmune disorders
                                                                                                                        ruman Cys-Cys chemokine receptor 5; CCR5; human immunodeficiency virus;
type 1; type 2; HIV-1; HIV-2; diagnosis; treatment; prevention;
inflammatory disease; rheumatoid arthritis; glomerulonephritis; asthma;
idiopathic pulmonary fibrosis; psoriasis; viral infection; cancer;
atherosclerosis; autoimmune disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Active and inactive forms of human CC chemokine receptor CCR-5 - useful to diagnose, prevent and/or treat inflammatory disorders, autoimmune disease and viral infection.

Novel human mature G-protein chemokine receptor HDGNRIC (AAW07602) is a 7-transmembrane protein involved in signal transduction. Its amino acid sequence was deduced from a cDNA clone (AAY44042) isolated from a human monocyte library. Isolation of the cDNA allows prodn. of recombinant HDGNRIC in host, e.g. E. coli, COS or Sf9, cells. The recombinant receptor can be used to identify agonists or antegonists of the receptor; such cpds. can be used to identify agonists or antegonists of the receptor; expression of G-protein chemokine receptors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC chemokine receptor 5; CCR5; G-protein coupled receptor; buman immunodeficiency virus; HIV; CD4; AIDS; therapy; transgenic animal.
                                                                                                                                                                                                                                                                                                                                    Human G-protein chemokine receptor, HDGNR10 - useful to identify (ant)agonists, for treatment of haematopoiesis, leukaemia, chronic and acute inflammation, rheumatoid arthritis, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   109. .120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This polypeptide sequence comprises macaque chemokine receptor 88C, a G mino sequence that is involved in leukocyte trafficking. Its amino sequence was deduced from a 88C DAM (AATS153) isolated by PCR amplification. It shows 97% identity to human 88C (AAM77123). 88C receptors and their polypeptide fragments can be produced in transformed host cells. The receptors, peptides comprising one or more of the extracellular or intracellular domains, and anti-receptor antibodies can be used to modulate receptor activities, particularly ligand and G ratheroslerosis, rheumatoid activities, particularly ligand and G protein binding, and are potentially potentially useful in the treatment of atheroslerosis, rheumatoid arthritis, tumours, asthma, viral infection, AIDS, inflammatory conditions, pathological immune response, abnormal haematopoietic processes etc. A hybridoma that produces an antibody that specifically binds to macaque 88C is claimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             G-protein chemckine receptor; HDGNR10; signal transduction; haematopoiesis; leukaemia; inflammation; rheumatoid arthritis; diagnosis;

chemokine receptor that has been designated CCRS. The sequence was deduced from an isolated CDNA clone (see AAT76920). An Ala12Tleu variant (see W181810 of CCRS was also identified. The susceptibility of human macrophages to HIV infection depends on cell surface expression of CD4 and CCRS. CCRS is a member of the 7-transmembrane superfamily of G-protein coupled cell surface molecules. It plays an essential role in the membrane fusion step of infection by some HIV isolates. The establishment of stable, non-human coll innes and transgenic mammals having cells that infection. Antibodies that bind to CCRS, cCRS variants, and CCRS-binding agents capable of blocking membrane fusion between HIV and target cells represent potential anti-HIV therapeutics for macrophage tropic strains

(first entry) HIV-1 co-receptor CCR5 15-MAR-1999

HIV-1; CCR5; CCR5m303; co-receptor; infection; diagnosis; AIDS; gene therapy; human.

AAY80128;

Homo sapiens

```
And are the interaction by macrophage-tropic (N-tropic) strains of a co-receptor for infection by macrophage-tropic (N-tropic) strains of HIV-1. The invention relates to the identification of a CCR5 variant (see AAW88211), designated CCR5, but lacking transmembrane domains 3-7. The commains of wild-type CCR5, but lacking transmembrane domains 3-7. The positive correlation with resistance to infection with M-tropic HIV-1 consists, and may indicate slower progression of the disease. The detection of CCR5 variants may be used to identify individuals at lower correlation with relative to the general population who, if infected, is any exhibit slower progression to AIDS. Probes and primers (see AAV84127-CC may exhibit slower progression to AIDS. Probes and primers (see AAV84127-CC slow variants. A method is provided for inhibiting the presence of such variants. A method is provided for inhibiting HIV-1 infection of a cell expressing the CCR5 receptor. This involves introducing a nucleic acid encoding a CCR5 variant into the cell, thereby reducing the number correctional CCR5 molecules present on the cell surface
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New CCRS variant protein of the HIV-1 co-receptor - useful in developing resistance of CCRS-expressing cells to {\rm HIV}-1 infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This is the amino acid sequence of wild-type human CCR5, which serves as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a human G-protein chemokine receptor designated HDGNR10 polymucleotides are useful in methods of screening the compounds which bind to and either: (1) activate the HDGNR10 polypeptides causing stimulation of haematopoiesis, wound healing, coagulation, and angiogenesis; treatment of solid tumours, chronic infections, leukaemia, T-cell mediated autoimmune diseases, parasitic infections, psoriasis, and to stimulate growth factor activity; or (2) inhibit activation of the HDGNR10 polypeptides which is useful for preventing and/or treating allergy, atherogenesis, anaphylaxis, malignancy, chronic and acute inflammation, histamine and immunoglobulin B-mediated allergic reactions, prostaglandin-independent fever, bone marrow failure, silicosis, sarcoidosis, theumatoid arthritis shock and hyper-eosinophilia syndrome. The polymucleotides are also useful for diagnostic assays for detecting the polymetocides are also useful for allered level of the soluble form of the receptor polypeptides. The polymucleotides are also useful for in vitro purposes related to mutations in the polymucleotides are also useful for in vitro purposes related to constitute of DNA vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                          Human, G-protein coupled receptor, G-protein chemokine receptor, HDGNR10, diagnosis, haematopoiesis, wound healing; coagulation, angiogenesis, throur; infection, leukaemia, psoriasis; allergy; T-cell mediated autoimmune disease, atherogenesis; anaphylaxis; inflammation, allergic reaction, silicosis; sarcoidosis; rheumatoid arthritis; hyper-eosinophilia syndrome.

The specification describes an antibody which is specific for an antigenic fragment of gpl20. This antigenic fragment binds to DC-SIGN or is exposed upon gpl20 binding of DC-SIGN due to concomitant conformational change. DC-SIGN is a receptor that is specifically expressed on dendritic cells and facilitates infection of T lymphocytes with HIV. DC-SIGN is identical to a HIV-1 gpl20-binding C-type lectin. DC-SIGN binds ICAM-3 (which is expressed constitutively on T lymphocytes) with high affinity. The antibody of the invention inhibits the trans enhancement of HIV entry into a T cell or macrophage facilitated by infection. The present sequence represents a human CCRS protein, which is a translocation promoting agent that interacts with CD4. This receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, G-protein chemokine receptor, CCR5, HDGNR10; inflammation, HIV, human immunodeficiency virus; antimicrobial; vasodilator; vulnerary; cytostatic; immunosuppressive, noctropic, neuroprotective; gene therapy; neurodegenerative disorder; Kaposi's sarcoma; autoimmune disease; rheumatoid arthritis; cancer; breast; ovary; adrenal gland; bone marrow; gastrointestinal tract; lung; liver; immune disorder; Addison's disease; haemolytic anaemia; autoimmune thyroiditis; diabetes mellitus; allergy; multiple sclerosis; ulcerative colitis; Crohn's disease; wound healing; cardiovascular disorder; myocardial ischaemia.

interaction. The disease or disorder may also be an infectious disease (e.g. a viral infection such as an early stage HIV infection, a cycomegalovirus infection, an autoimmune disease (e.g. rheumatoid arthritis) or a neurodesenerative disorder. The disease or disorder may be associated with aberrant CCR5 expression, lack of CCR5 function, aberrant CCR5 ligand expression, or lack of CCR5 ligand expression, or lack of CCR5 ligand expression, or lack of CCR5 ligand concrease or decrease storage capabilities. CCR5 HGGMLO DNA are useful to increase or decrease storage capabilities. CCR5 HGGMLO DNA, or protein, antibodies, agonists and antagonists are also useful in the concretion, antibodies, agonists and antagonists are also useful in the diagnosis, treatment and prevention of cancer (breast, ovary, adrenal curagenital); immune disorders (Adabson's disease, allergies, autoimmune curagenital); immune disorders (Adabson's disease, allergies, autoimmune thyroiditis, diabetes mellitus, crohm's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis); cardiovascular disorders (myocardial ischaemias) and wound healing. The present sequence is human CCR5 HDGNRIO protein
                                                                                                                                                                                                                                                                                                                                                                     Query Match
                                                                                                                                                                                                                                                                                                                                                                                       Best Loc

The invention relates to human G-protein chemokine receptor (CCR5)

HDGNR10 polypeptides and polynucleotides. CCR5 HDGNR10 antibodies are
useful for treating, preventing or ameliorating a disease or disorder
associated with inflammation, defective or aberrant chemotraxis of immune
cells, HIV infection (such as Pneumocystis carinii pneumonia or Kaposi's
cells, HIV infection such as Pneumocystis carinii pneumonia or Kaposi's
interaction. The disease or disorder may also be an infection, a
cytomegalovirus infection such as an early stage HIV infection, a
cytomegalovirus infection, or a poxyitus infection, a autoimmune
cisase (e.g. rheumatoid arthritis) or a neurodegenerative disorder. The
disease or disorder may be associated with aberrant CCR5 expression, lack
of CCR5 function, aberrant CCR5 ligand expression, or lack of CCR5 ligand
function. CCR5 HDGNR10 protein is used as a food additive or preservative
cof CCR5 function, and in gene therapy. CCR5 HDGNR10 DNA,
cof ccR6 function and in gene therapy. CCR5 HDGNR10 DNA,
cof cornomosome identification and in gene therapy. CCR5 HDGNR10 DNA,
protein, antibodies, agonists and antegonists are also useful in the
cornomosome identification and in gene therapy. CCR5 HDGNR10 DNA,
cof diagnosis, treatment and prevention of cancer (breast, overy, adrenal
cornomosome identification and in gene therapy. CCR5 HDGNR10 DNA,
cornomosome is numanne thyroiditis, diabetes mellitus, Crohn's
curogenital); immune disorders (Mocandial ischaemias) and wound healing. The
cordivosacular disorders (Mycoardial ischaemias) and wound healing. The
cornomosome is humann CCR5 HDGNR10 proteinias) and wound healing. The
cornomosome is humann CCR5 HDGNR10 proteinians
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Chemokine, tumour diagnosis, colorectal, prostatic, organ rejection, inflammation, autoimmune disease, metastasis, bronchial asthma, lupus, chronic bowel inflammation, rheumatoid arthritis, cytostatic, antiinflammatory, antiasthmatic, immunosuppressive, dermatological,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             100.0%; Score 118; DB 4; Length 352; 100.0%; Pred. This invention describes a novel diagnostic agent (A) comprising at least two different ligands (I) for receptors (II) that are implicated in disease. (A) are used for the diagnosis of tumors (especially colorectal or prostatio), organ rejection, inflammation and autoimmune diseases. Also inhibitors of (I) are used therapeutically against tumors (and their metastases), inflammation (particularly bronchial asthma or chronic bowel inflammation), or autoimmune diseases (theumatoid arthritis or lupus), where the (cardio) wascular, lymphatic, respiratory, nervous, diseasive, endocrine, motor or urogenital systems or skin are affected, and bone marrow diseases. The products of the invention are chemokine derivatives immunosuppressive, dermatclogical, antirheumatic, antiarthritic. Chemokines act on specific tumor and inflammatory cells through a conscellation of chemokine and inflammatory cells through a proliferation of these cells. Adag0045-AAG80128 represent human chemokine fragments used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; transformed mammalian cell; CD4; reporter gene; translocation;
human immuno deficiancy virus; HIV; long terminal repeat; LTR; therapy;
chemokine receptor; CKR; cellular dysfunction; HIV infection; cofactor;
CC-CKR-5; envelope glycoprotein; anti-HIV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Transformed mammalian cell (I) that contains a CD4 gene, reporter gene and HIV LTR for identification of drugs and antibodies for treatment of

contains a gene encoding CD4, a construct encoding a reporter gene under the regulation of an human immuno deficiency virus (HIV) long terminal repeat (LTR) and that has been transduced with a vector encoding a human chemokine receptor (CTR) where the CD4 and the CMR are present on the cell surface of transformed mammalian cell. The invention is useful for identifying drugs or antibodies that interfere with the translocation of receptor that facilitates the infection of a particular HIV strain into the transformed mammalian cell. Compounds identified can be used to treat sequence is a human chemokine receptor (CKR), CC-CKR-5 related protein. CC-CKR-5 is the principal cofactor for entry mediated by the envelope glycoproteins of primary macrophage-tropic strains of HIV-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; G-protein chemokine receptor; CCR5; HDGNR10; inflammation; HIV; human immunodeficiency virus; antimicrobial; vasodilator; vulnerary; cytostatic; immunosuppressive; noctropic; neuroprotective; gene therapy; neurodegenerative disorder; Kaposi's sarcoma; autoimmune disease; rheumatoid arthritis; cancer; breast; ovary; adrenal gland; bone marrow; gastrointestinal tract; lung; liver; immune disorder; Addison's disease; haemolytic aneemis; autoimmune thyroiditis; diabetes mellitus; allergy; multiple sclerosis; ulcerative colitis; Crohn's disease; wound healing;

The present sequence is human G-protein chemokine receptor (CCR5) HDGNRIO protein. CCR5 HDGNRIO cDNA is included in ATCC Deposit No: 97183. CCR5 HDGNRIO antibodies are useful for treating, preventing or ameliorating a disease or disorder associated with inflammation, defective or aberrant chemotaxis of immune cells. HTV infection (such as Pneumocystis carini presenting cell interaction. HTV infection (such as Pneumocystis carini presenting cell interaction. The disease or disorder may also be an infection, a cytomegalovirus infection such as an early stage HIV infection, a cytomegalovirus infection, or a poxvirus infection, an infection, a cytomegalovirus infection, or a poxvirus infection, or a cutoimmune disease (e.g. rheumatoid arthritis) or a neurodegenerative context infection, aberrant CCR5 ligand expression, or lack of CCR5 function. Aberrant CCR5 ligand expression, or lack of CCR5 ingent in the disease or decrease storage capabilities. CCR5 HDGNRIO DNA are useful for chromosome identification and in gene cherapy. CCR5 HDGNRIO DNA, protein, antibodies, agonists and antagonists are also useful in the diagnosis, treatment and prevention of cancer contemporation and in gene conformune hammolytic anaemia, autoimmune thyroiditis, diabetes mellitus, colling, cardiovascular disorders (Madison's disease, allergies, colling); cardiovascular disorders (myocardial ischaemias) and wound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Isolated nucleic acid encoding a human G-protein chemokine receptor (CCRS) HDGNR10 polypeptide, useful for preventing or treating autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders and

The present sequence is human G-protein chemokine receptor (CCR5) HDGNR10 protein. CCR5 HDGNR10 antibodies are useful for treating, preventing or ameliorating a disease or disorder associated with inflammation, ameliorating a disease or disorder associated with inflammation, or defective or aberrant chemotaxis of immune cells, HIV infection (such as Pneumocystis carinii pneumonia or Kaposi's sarcoma) or defective or aberrant T-cell antigen presenting cell interaction. The disease or disorder may also be an infectious disease (e.g. a viral infection such as an early stage HIV infection, a cytomegalovirus infection, or a poxvirus infection), an autoimmune disease or disorder may be associated with aberrant CCRS expression, lack of CCRS function, aberrant CCRS or lack of CCRS function. CCRS HDGNR10 protein is used as a food additive or preservative to increase or decrease storage capabilities. CCRS HDGNR10 DNA are useful for chromosome identification and in gene therapy. CCRS HDGNR10 DNA, protein, and prevention of cancer (breast, ovary, adrenal gland, bone, bone marrow, gastrointestinal tract, liver, lung, urogenital); immune disorders (Addison's disease, multiple sclerosis, rheumatcid arthritis and ulcerative colitis); cardiovascular culcimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatcid arthritis and ulcerative colitis); cardiovascular culcimmune thyroiditis and more wound healing

New human G-protein chemokine receptor polypeptides and polynucleotides, useful for identifying (ant)agonists to the G-protein chemokine receptor

Claim 1a; Page 15; 22pp; English.

This invention describes a novel receptor polypeptide (I) selected from (I) a fully defined 329 amino acid sequence (II) fully disclosed in the specification; and (ii) a polypeptide encoded by the cDNA contained in a plasmid, and fragments, analogs and derivatives of the polypeptide. The products of the invention have antiinflammatory, immunomodulatory, anticoagulant, antiallergic, immunosuppressive, vulnerary, cytostatic, antiparasitic, antiparatic, antiphoratic, antiarchritic and vasotropic activity and can be used for gene therapy. The G-products of the invention activate or inhibit activation of (I). The products of the invention can also be used for stimulating nematopoiesis, wound healing, coagulation, also be used for stimulating hematopoiesis, wound healing, coagulation, also be used for stimulating activation. HDGNRIO is useful for treating stimulating growth factor activity, HDGNRIO is useful for treating stimulating growth factor activity, HDGNRIO is useful for treating allergy, atherogenesis, anaphylaxis, malignancy, chronic and acute inflammation, histamine and immunoglobulin E (IgB) -mediated allergic reactions, prostaglandin-independent fever, bone marrow failure.

This sequence represents the human CCR5 protein sequence. The invention relates to a method for determining whether an agent is capable of modulating the interaction of chemotractic chemokine receptor 5 (CCR5) with gp120, comprising incubating the agent with CCR5 and gp120 and determining whether the agent modulates the interaction, where gp120 is associated with CDP4, and where the interaction is a low affilmity binding. The method is used to identify an agent capable of modulating the interaction of CCR5 with gp120. An agent identified by the method is used to prepare a pharmaceutical composition for the treatment of a disease or condition associated with CCR5 and gp120 interaction, to treat a subject with a disease or condition associated with CCR5 and gp120 interaction, to prepare a pharmaceutical for treating human immunodeficiency virus (HIV). It can also be treat anti-inflammatory diseases. The method is commercially useful, amenable to high throughput screening, and cetects interaction of gp120 with cells expressing only CCR5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Determining if an agent can modulate CCRS-gp120 interaction, comprises incubating the agent with CCRS and gp120 and determining if the agent
                                                                                                                                                     Chemotactic chemokine receptor 5; gp120; CD4; therapy; HIV; CCR5; human immunodeficiency virus; anti-inflammatory disease; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              100.0%; Score 118; DB 4;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying agonists of G protein-coupled receptors (GPCRs) for use in disease treatment, comprises contacting candidate compounds with versions of GPCRs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to G protein-coupled receptors (GPCRs) for which the endogenous ligand has been identified. Non-endogenous constitutively activated versions of known GPCRs are used in the invention for the direct identification of candidate compounds as receptor agonists, inverse agonists or partial agonists. Such agonists are useful as therapeutic agents for diseases or disorders associated with GPCRs. The present sequence is a non-endogenous version of a known human GPCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                             Gaps
silicosis, sarcoidosis, rheumatoid arthritis, shock and hypereosinophilic syndrome. (N.B. This record was resubmitted to correct errors in the keyword formatting)

Claim 1; Page 30; 163pp; English.

The present sequence is that of human HIV-1 co-receptor CCR5. Amino acids cashe in the N-terminal region of CCR5 comprise an HIV-1 gpl20-binding set that determines the specificity of the interaction between CCR5 and HIV-1 gpl20. Post-translational sulfation of the tyrosine residues in the CCR5 N-terminus is required for gpl20 binding and may critically modulate the susceptibility of target calls to HIV-1 infection in vivo. The invention provides claimed sulfated peptides (see AAB82947) that are based on the CCR5 N-terminal region and which are effective for inhibiting HIV-1 binding to CCR5. These peptides are used in claimed methods of inhibiting HIV infection of CO4+ cells, of preventing CD4+ cells are infected with HIV, of treating a subject whose CD4+ cells are infected with HIV, and of identifying an agent which inhibits binding of a CCR5 isopeially a human, infected (therapeutic method), not infected with HIV (prophylactic method), or in a subject who is not infected with, but has been exposed to, HIV

New nucleic acid encoding an antibody specific for the G-protein chemokine receptor CCRS, useful for treatment and diagnosis of e.g. inflammation.

Claim 61; Fig 1; 180pp; English.

The present invention relates to the isolation of a novel human G-protein chemokine receptor (CCR5) designated HDGNR10, and polymucleotide sequences encoding it. The invention also describes antibodies that bind human G-protein chemokine receptor (CCR5) HDGNR10 and polymucleotide.

Chuman G-protein chemokine receptor (CCR5) HDGNR10 and polymucleotide.

Sequences encoding the antibodies. The antibodies are useful for treating or preventing inflammation, defective or aberrant chemotaxis of immune cells and T-cell/antigen-presenting cell interactions, infections and utoimmune diseases, rheumatoid arthritis, neurodegeneration, viral infections (sepecially early stage human immune deficiency virus (H1V), cytomegalovirus or pox virus infections, Kaposi sarcoma, or conditions associated with aberrant or deficient expression of the CCR5 receptor or its ligands. The antibodies are also useful to determine CCR5 expression, e.g. for diagnosis, prognosis and monitoring of cancer and other hyperpoliferative diseases. The polymucleotide sequences encoding human combinant receptor, and in the treatment of a wide range of diseases such as infectious diseases (e.g. influenza), neurological diseases (e.g. HDGNR10 and the receptor (CCR5) HDGNR10 and seceptor (CCR5) HDGNR10 and chemokine receptor (CCR5) HDGNR10 in the present sequence represents human G-protein chemokine receptor (CCR5) HDGNR10 in the creeptor (CCR5) HDGNR10 in the present sequence represents human G-protein chemokine receptor (CCR5) HDGNR10 in the present chemokine receptor (CCR5) H

Identifying CC chemokine receptor 5 binding compound for treating AIDS, comprises binding a molecule from library to a molecule having binding property corresponding to CCR5 and identifying bound molecule.

Example 3; Fig 4B; 50pp; English.

The invention relates to a method for identifying a binding compound for chemokine receptor 5 (CCRS). The method involves screening a library of test molecules (particularly peptides) with immobilised CCRS, and then identifying those molecules which bind. The invention also relates to identifying those molecules which bind. The invention also relates to CCRS-binding molecules identified using the method of the invention, cc transfer vector encoding tagged CCRS, a computer-aided methods for identifying consensus motifies for CCRS-binding peptides, a transfer vector encoding tagged CCRS, a computer aided methods for ca computer aided drug screening assay that utilises the three-dimensional cs tructure of CCRS. Compounds identified using the methods of the invention are useful for treating or preventing HTV (human invention are useful for treating or preventing HTV (human cransplands) infection or AIRS (acquired immunodeficiency virus) infection are allowable of the invention may also be used to identify agonists or antagonists of the interaction of CCRS, with its cateuring and and to determine a binding motif for CCRS. The present cs equence represents a naturally occurring variant of human CCRS in which there is a glutamine, rather than a leucine, at position 55

The invention relates to a method for identifying a binding compound for C chemokine receptor 5 (CCR5). The method involves screening a library C of test molecules (particularly peptides) with immobilised CCR5, and then identifying those molecules which bind. The invention also relates to carbiding molecules identified using the method of the invention, methods for identifying consensus motifs for CCR5-binding peptides, a transfer vector encoding tagged CCR5, a computer-aided methods for determining the relative binding assay that utilises the three-dimensional a computer aided drug screening assay that utilises the three-dimensional structure of CCR5. Compounds identified using the methods of the invention are useful for treating or preventing HTV (human immunodeficiency virus) infection or AIDS (acquired immunodeficiency syndrome) in a patient. The methods of the invention may also be used to identify agonists or antagonists of the interaction of CCR5. The present structure is represent human CCR5.
                                                                                                                                                                                                                                                                                           CCR5; CC chemokine receptor 5; human; HIV infection; human immunodeficiency virus; AIDS; acquired immunodeficiency syndrome; drug screening; identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying CC chemokine receptor 5 binding compound for treating AIDS, comprises binding a molecule from library to a molecule having binding property corresponding to CCR5 and identifying bound molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Tan Hehir CA;

Novel human G-protein chemokine receptor polypeptide useful for identifying modulators for stimulating hematopoiesis, wound healing, leukemia, for treating allergy, rheumatoid arthritis, shock and as research agents. Novel

Claim 7; Fig 1; 22pp; English.

The present invention relates to the isolation of human G-protein chemokine receptor, HDGNR10 (CCR5 receptor), and the polymucleotide sequences sequence encoding it. HDGNR10 polymeptide and polymucleotide sequences can useful for diagnosing a disease or a susceptibility to a disease. The call the construction of HDGNR10. They are useful for identifying modulators for stimulating haematopoiesis, wound healing, coagulation, angiogenesis, to treat solid tumours, orbonic infections, psoriasis, or for stimulating growth factor activity. The sequences are also useful for preventing and/or treating allergy, atherogenesis, anaphylaxis, malignancy, chronic and acute inflammation, histamine and immunoglobulin E (IgE)-mediated allergic reactions, prostaglandin-independent fever, bone marrow failure, sarcoidosis, rheumatoid arthitis, shock and hyperbone marrow failure. Polymucleotide sequences encoding HDGNR10 can be used in gene therapy to treat conditions related to underexpression of HDGNR10. The present sequence represents human G-protein chemokine receptor, HDGNR10

New human G-protein Chemokine Receptor gene (HDGNR10) useful for treating, preventing, ameliorating or monitoring diseases or disorders associated with aberrant expression of HDGNR10 e.g. cancer.

Example 55; Fig 4; 562pp; English

The invention describes an isolated polynucleotide encoding a first antibody at least 95-100% identical to a second antibody consisting of antibody at least 95-100% identical to a second antibody consisting of a variable heavy (VH) or variable light (VL) domain of the antibody consisting of a variable heavy (VH) or variable light (VL) domain of the antibody consisting of xF3.642, XF3.1089, XF22.3C9.6, XF22.956, XF27/28.1957, XF27/28.1855, XF27/28.1856, XF27/28.36710, XF27/28.36710, XF27/28.36710, XF27/28.36710, XF27/28.3857, XF2

The invention describes an isolated polymucleotide encoding a first antibody at least 95-100% identical to a second antibody consisting of an antibody at least 95-100% identical to a second antibody consisting of an article antibody comprising at least one, two or three CDR regions of a variable heavy (VH) or variable light (VL) domain of the antibody consisted by a hybridoma cell line consisting of XF3.5F1, XF11.1F8, XF27/28.25G10, XF27/28.3E6, XF27/28.3E7, XF27/28.3E1.8E5, XF27/28.4B2.5C2, XF27/28.4B2.1B2.7C2, XF27/28.4B2.5C2, XF27/28.4B2.5C2

CCR5 antibodies are used for the treatment or prevention of inflammation, defective or aberrant chemotaxis of immune cells or T cell antigenpresenting cell interaction, viral infections (specifically human immune deficiency (including its early stages), cytomegalo or pox viruses), autoimmune disease, rheumatoid arthritis, neurodegeneration, Pneumocystis carinii infection, Raposi's sarcoma or any condition associated with aberrant expression of CCR5 or their ligands. They are also used for the detection, diagnosis, prognosis and monitoring of cancers or other hyperproliferative diseases. The present sequence is human G-protein
dermatitis and rheumatoid arthritis, allergies, a neurodegenerative disorder, a viral infection e.g. HV infection, cytomegalovins or poxvirus infection, a Pneumocystis carnii infection, Kaposi's sarcoma, cardiovascular disorders such as atherosclerosis, lymphocytopenias, or a disoase or disorder associated with aberrant expression of novel human Gprotein chemokine receptor (CCRS) HDGNR10. This is an amino acid sequence of Human G-protein chemokine receptor (CCRS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid encoding antibodies to the human CCRS receptor HDGNR10, useful for treatment, prevention and diagnosis of e.g. cancer, also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, G-protein chemokine receptor; CCR5; HDGNR10 protein; cancer; inflammation; viral infection; autoimmune disease; neurodegeneration; rheumatoid arthritis; Pneumocystis carinii infection; Kaposi's sarcoma;

The invention relates to human G-protein chemokine receptor (CCR5), antibodies are used for the treatment or prevention of inflammation, defective or aberrant chemotaxis of immune cells or T cell antigenpresenting cell interaction, viral infections (specifically human immune deficiency (including its early stages), cytomegalo or pox viruses), autoimmune deficiency kaposi's sarroma or any condition associated with aberrant expression of CCR5 or their ligands. They are also used for the detection, diagnosis, prognosis and monitoring of cancers or other hyperproliferative diseases. The present sequence is human G-protein chemokine receptor (CCR5), HDGNR10 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acid encoding antibodies to the human CCR5 receptor HDGNR10, useful for treatment, prevention and diagnosis of e.g. cancer, also related antibodies.
                                                                                                                                                                                                                         Human, G-protein chemokine receptor; CCR5, HDCNR10 protein; cancer; inflammation; viral infection; autoimmune disease; neurodegeneration; rheumatoid arthritis; Pneumocystis carinii infection; Kaposi's sarcoma; hyperproliferative disease; receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Score 118; DB 5; Length 352;

The present sequence is that of a polypeptide encoded by the human chemokine (C-C motif) receptor 5 (CCR5) gene of the invention (See ABA97319). The specification describes haplotyping the CCR5 gene of an individual by determining if the individual has one of the CCR5 specification also describes an isolated polymothetoride comprising a nucleotide sequence which is polymorphic variant of the reference CCR5 gene sequence which is a nisogene defined by a haplotype described nucleotide sequence and comprises an isogene defined by a haplotype described on the specification and its encoded polypeptide. The methods of the invention are useful to diagnose and develop treatment for diseases a ssociated with abnormal expression or function of the gene. The CCR5 isogenes and the screened compounds are useful for treating human communodeficiency virus (HTV)-1 infection and the progression to acquired immunodeficiency virus (HTV)-1 infection and the progression to acquired immunodeficiency virus (HTN)-1 infection and the progression to acquired individual; predicting a haplotype pair for the CCR5 gene of an individual; predicting a haplotype pair for the CCR5 gene of an individual; predicting a passociation between a trait and a haplotype or composition comprising a genotyping oligonucleotide for detecting a CCR5 polymorphism; a recombinant non-human organism transformed with CCR5 polymorphism; a recombinant non-human organism transformed with exquence an isolated antibody specific for the CCR5 polypeptide and a method for screening drugs targeting the CCR5 polypeptide
                                                                                                    Human chemokine C-C motif receptor 5; CCR5; haplotype pair; isogene; single nucleotide polymorphism; SNP; human immundeficiancy virus 1; HIV-1 infection; acquired immunodeficiancy syndrome; AIDS; antiviral; genotype; polymorphic variant; transgenic; drug screening; gene therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New haplotypes of the human chemokine (C-C motif) receptor 5 gene, to diagnose and treat diseases associated with its abnormal express function, including human immunodeficiency virus-1 infection.
                                                              Human chemokine (C-C motif) receptor 5 polypeptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             which has been identified as a G-protein chemokine receptor. The GPCR HDGNR10 polypeptide can be expressed by standard recombinant methodology. Compounds that activate or inhibit the receptor polypeptide, optionally expressed from DNA in gene therapy vectors; are used to treat diseases that require: (a) activation of the receptor (e.g. stimulation of haematopoiesis, treatment of solid tumours, T-cell mediated autoimmune diseases, parasitic infections, psoriasis etc.); or (b) inhibition of the receptor (e.g. allergy, inflammation, rheumatoid arthritis, silicosis etc.). The present sequence represents the human HDGNR10 receptor
                                                                                                                                                                                                                                                                                                                                                                                 7-transmembrane receptor; G-protein coupled receptor; GPCR; HDGNR10; G-protein chemokine receptor; haemacopoleric; immunosuppressant; antiparasitic; gene therapy; human; receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polynucleotide encoding a human G protein chemokine receptor HDGNR10, useful e.g. for treating tumors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel human 7-transmembrane receptor, HDGNR10,

The invention discloses a G-protein chemokine receptor (sometimes ceferred to as a 7-transmembrane receptor) polypeptide, HDGNR10, and the polymucleotide encoding it. G-protein chemokine receptors are involved in signal transduction pathways. The polymucleotide and polypeptide can be used to identify compounds which activate or inhibit activation of the used to identify compounds are useful for treating a patient having need to activate or inhibit a G-protein chemokine receptor. The compound is administered by providing to the patient DNA encoding the agonist or antagonist and expressing them in vivo (gene therapy). The polymucleotides and polypeptide are also useful for for diagnosing a disease or susceptibility to a disease related to an under-expression of the protein. For chromosome identification or as immunogens for producing antibodies. Agonists are useful in stimulating haematopolesis, whond halling, coagulation, angiogenesis, to treat solid tumours, chronic infections, periasis and to stimulate growth factor activity.

Antagonists are useful in the prevention and treatment of allergy, atherogenesis, anaphylaxis, malignancy, chronic and acute inflammation, histendine and igE-mediated allergic reactions, protesplandini independent fever, hone marrow failure, silicosis, sarcoidosis, rhemmatoid arthritis, shock and hyper-eosinophilic syndrome. The sequence presented is the human HDGNR10 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel human G-protein chemokine receptor polypeptide useful for diagnostic purposes and for identifying modulators of the polypeptide useful for treating leukemia, autoimmune diseases, psoriasis and allergic
                                                                                                                                                                                                                                                                      Human; receptor; G-protein chemokine receptor; 7-transmembrane receptor; HDGWR10; signal transduction; gene therapy; haematopolesis; wound healing; coagulation; angiogenesis; tumour; chronic infection; leukaemia; T-cell mediated auto-immune disease; parasitic infection; psoriasis; growth factor; allergy; atherogenesis; anaphylaxis; malignant, infermediate, instamine; Igg-mediated; prostaglandin-independent fever; bone marrow failure; silicosis; sarcoidosis; rheumatoid arthritis; shock; hyper-eosinophilic syndrome.

```
The present invention describes an isolated nucleic acid molecule, which comprises the sequence of any of the genes that are up-regulated or down-cegulated in specific cancers (e.g. about 1031 genes up-regulated in a cequlated in a partial cancers (e.g. about 1031 genes up-regulated in a caute lymphocytic leukemia). ACC72641 to ACC72860 represent cancer related gene nucleotide sequences which encode the proteins given in ABBSB8701 to ABBSB8703. Also described: (1) determining the presence or absence of a pathological cell in a patient; (2) an expression vector comprising the vector; (4) an isolated polypeptide, which is encoded by the nucleic acid, (5) an antibody that specifically binds the polypeptide of (4); (6) specifically targeting a compound to a pathological cell in a patient by administering to the patient the antibody above; and (7) a cut greening a pathology, e.g. cancer (e.g. cancer of the bone marrow, charapentic targets. In particular, the nucleic acid is useful for the panceras, prostate, skin and uterum), wounds, ischaemia, heart diseases, ather serior cancer cancer for treating these control of the patient of the patient of the patient of the bone marrow, cancers, prostate, skin and uterum), wounds, ischaemia, heart diseases, and condometriosis. The nucleic acid is also useful in the control of the patient of the pati
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New genes that are up-regulated or down-regulated in cancers, useful a markers for diagnosing e.g. cancer, ischemia or heart diseases, or as therapeutic targets for screening drugs for treating these diseases.
                                                                                                                                                                                                                                                  Human, cancer; diagnosis; screening; modulator; leukaemia; ischaemia; heart disease; atherosclerosis; endometriosis.
